

Cervical Screening Programme

England

2005-06

KEY FACTS

At 10th August 2006:

- Over the last ten years the percentage of eligible women who have been screened at least once in the previous 5 years has been declining slightly to 79.5% in 2006 compared with 80.3% last year and 82% in 1996.
- Coverage was 80% or higher in 194 of the 303 Primary Care Organisations (PCOs). A drop compared to last year when 207 PCOs reached this level.

2005-06

- 3.6 million women (all ages) were screened, the majority after a formal invitation from the screening programme, a similar amount to 2004/05.
- While numbers of women invited (25-64) has dropped from 4.15 to 4.06 million in the last year, a decrease of 2.2%, the numbers of women screened has risen from 3.28 to 3.36 million, an increase of 2.4%.
- Laboratories examined just under 4.0 million samples (for women of all ages), about 1% fewer than in 2004-05.
- The percentage of inadequate samples has fallen from just over 9% over the last few years, to the lowest figure recorded: 7.2%, the main reason is likely to be the introduction of Liquid Based Cytology (LBC) as a method of taking samples.
- The percentage of women notified of their results within 6 weeks was 56%: similar to last year (57%). However the percentage of women notified within 4 weeks increased to 32% compared to 29% last year.
- Whilst the percentage of laboratory tests reported within 4 weeks has fallen from 61% in 2004-05 to 58% in 2005-06, the percentage reported, within 2 weeks has risen (from 29% to 31%).
- The percentage of women offered their first appointment for colposcopy within 4 weeks of referral remains unchanged from the previous year at 43%. For moderate or worse categories, 71% were referred within 4 weeks compared with 68% in 2004-05.

INTRODUCTION

1.1 Information on the Cervical Screening Programme has been collected since 1988-89 on the following Information Centre (previously Department of Health) returns:

- KC53 – information from the call and re-call system, collected from all Primary Care Organisations.
- KC61 – information on screening samples examined by pathology labs, collected from laboratories carrying out cervical cytology.
- KC65 – information on referrals to colposcopy and subsequent treatment and outcome, collected from clinics/trusts providing colposcopy services.

1.2 KC53 returns were received in respect of all 303 Primary Care Organisations (PCOs). KC61 returns were received from 134 laboratories known to carry out cervical cytology. KC65 returns were received from 229 clinics/trusts providing colposcopy services. In some instances, smaller clinics have included their data in the main hospital return.

1.3 National policy for the screening programme is that eligible women should be screened every 3 or 5 years (this varies according to age, women aged 25-49 are screened every 3 years, those aged 50-64 every 5 years). Since 2003, women aged 25 to 64 have been eligible for routine screening, with routine invitations to begin at age 25. In this bulletin, the target group of 25-64 has been used wherever possible.

1.4 In presenting laboratory statistics, data about samples from GP and NHS Community Clinics have been used in most tables in preference to data about samples from all sources, so as to reflect

more closely the results from screening programme tests.

1.5 Data issues

This publication is usually published in October but this year it has been delayed due to technical issues with the NHAIS (Exeter) system in some parts of the country affecting coverage and time since last adequate tests data from the KC53 return.

In 2005 a ceasing audit was carried out to ensure that no women were inappropriately ceased from the programme. Some of the amendments made in this exercise resulted in the dates that women were ceased from the screening programme being reset to the date of the amendment and not the actual date ceased. To ensure accuracy of coverage/time since last adequate test, a software patch was applied and a re-run of the data was carried out based on August (run in November), resulting in a delay to the publication.

Consequently coverage and time since last test data for 2006 is based on August, rather than March as in previous years. All other data covers the year April 2005 to March 2006.

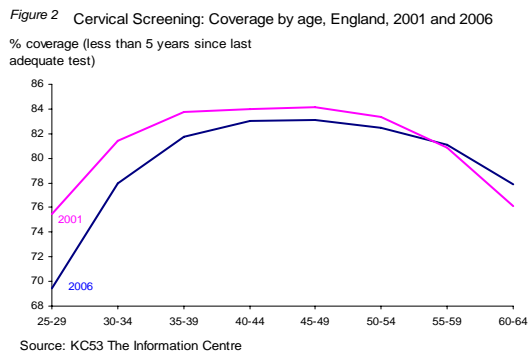

2 ANALYSIS AND COMMENTARY - CALL AND RECALL PROGRAMME

2.1 Coverage

(Tables 1, 2, 3, 3a, 11, 12 and 13)

2.1.1 About 79.5% of eligible women, aged 25-64 at 10th August 2006 were recorded as being less than 5 years since their last adequate test result. Coverage has been falling slightly over the last ten years and this is the first year it has dropped below 80% since the early 1990s. However figures prior to 1995 are not directly comparable, being based on a period since last test of 5.5 years and not adjusted to exclude women with recall ceased for non-clinical reasons (Figure 1).

2.1.2 The falling coverage is mainly evident in the lower age groups, with the 50-64 age groups showing very little change over the last few years. (Figure 2).

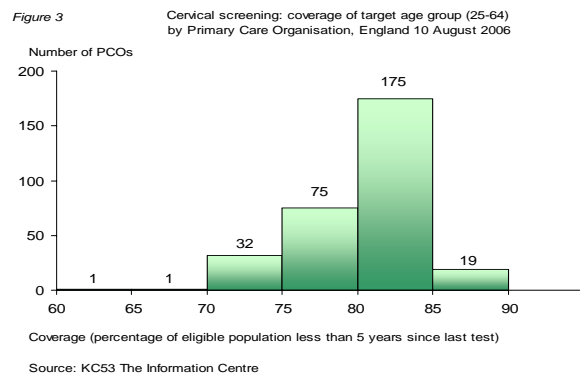

2.1.3 Coverage of the target age group 25-64 in 2005-06 varied considerably between Strategic Health Authorities, with 6 achieving over 80% and 4 below (of which 3 were between 79.4% and 79.9%) The highest reported coverage was in the East Midlands at 83.1%, the lowest was London at 74.2%. The percentage difference in coverage from 2004-05, fell slightly in each region, ranging from a fall of 0.1% in the South West to 1.3% in London.

At Primary Care Organisation (PCO) level, 19 of the 303 PCOs reported coverage of

85% or higher, 175 between 80% and 85% and 109 below 80% (Figure 3 and 3a).

2.1.4 Information collected on the period of time since a woman was last tested, suggests that in addition to the 73% of women in the 25-64 age group (including those with recall ceased for any reason) who on 10th August 2006 were less than 5 years since their last test, a further 8% were within 10 years of their last test and 2% were within 15 years. About 1.1% of women were reported as having had at least one adequate screening test, but not within the last 15 years. Only 0.3% had attended but never had an adequate test, 7.3% had been called but had not attended for screening and 0.1% of women in the target age group were reported as having no cytology record at all.

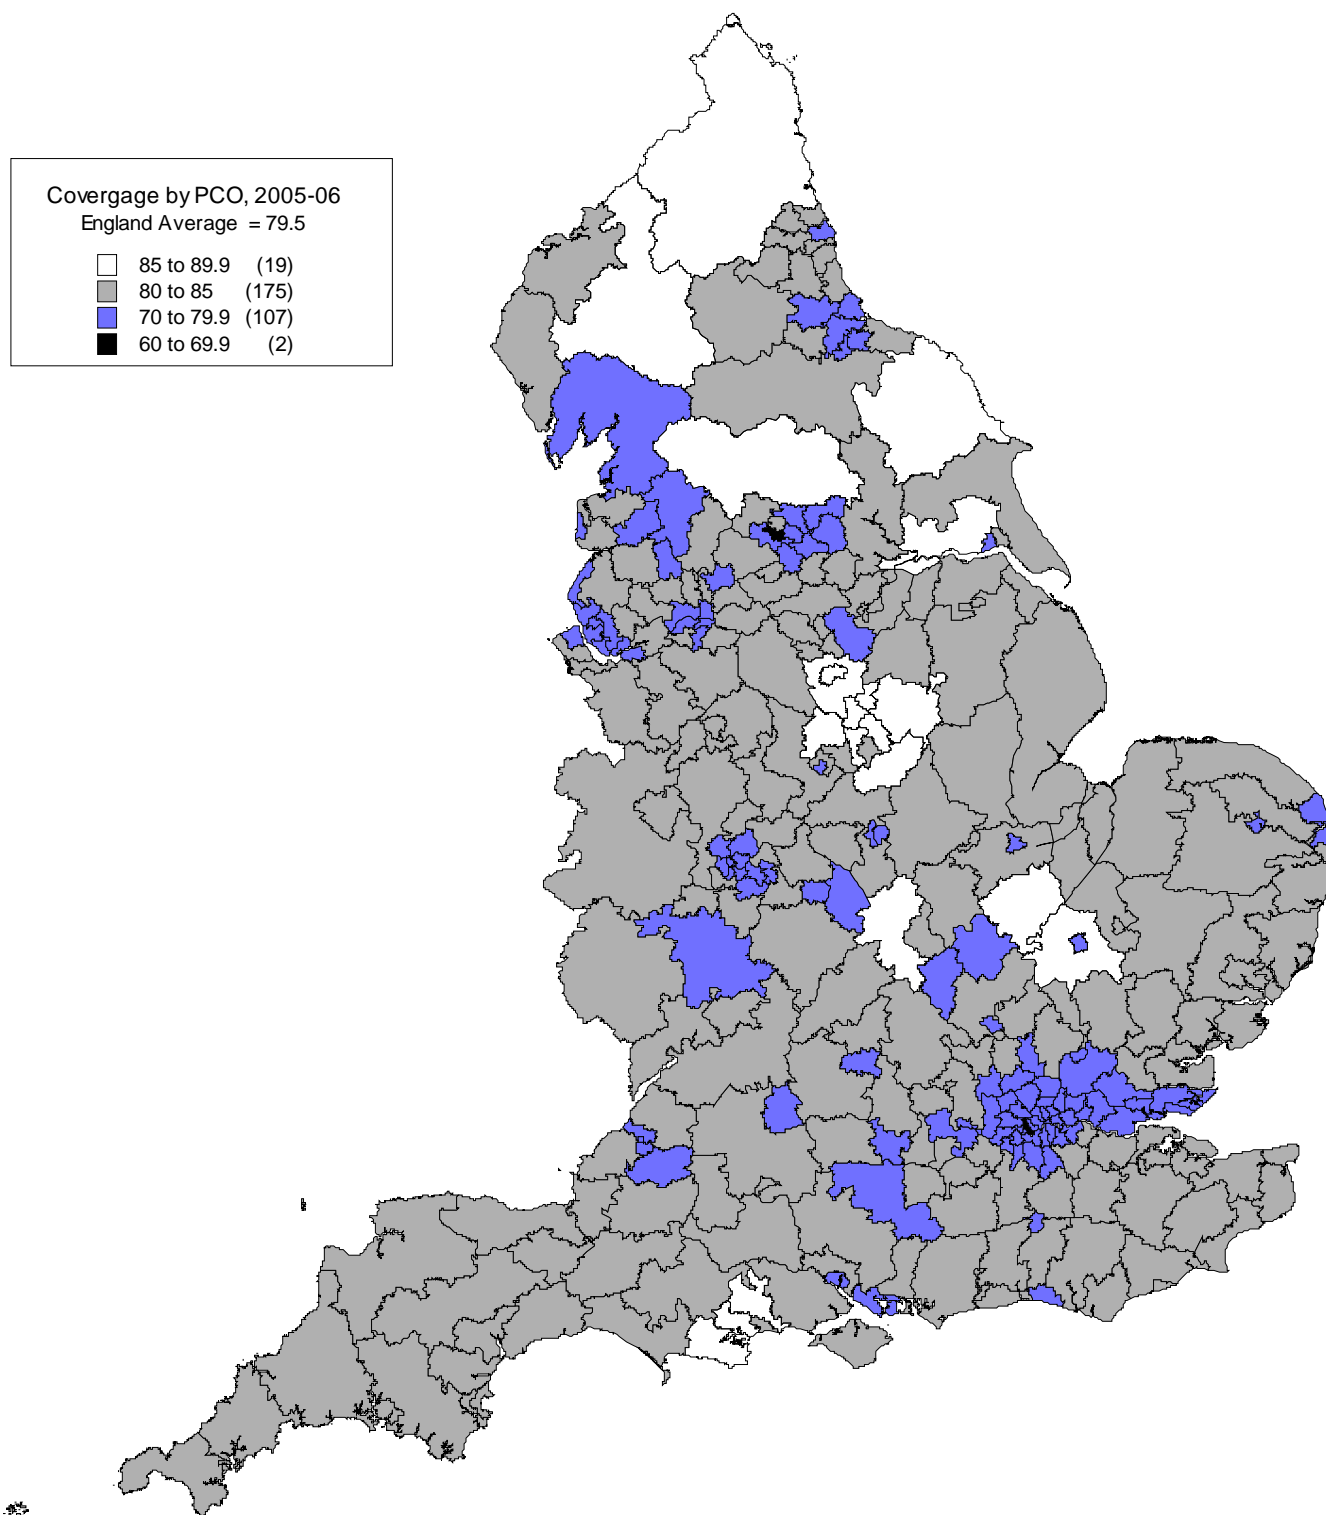

2.2 Invitations for screening (Tables 4, 5 and 11)

2.2.1 About 4.4 million women of all ages were invited for screening in 2005-06, a fall of 6.3% compared with 2004-05. For 13% of women this was their first invitation (call) and for 63% a routine recall. About 14% of invitations were early recalls for surveillance, 4% were early recalls following persistent findings of borderline changes or mild dyskaryosis and 6% were recalls following inadequate tests.

2.2.2 About 3.4 million women in the target age range 25-64 were tested in the year. Of these 2.7 million were tested following an invitation within the screening programme. About 0.7 million women

Figure 3a

**Cervical screening: Percentage coverage by
Primary Care Organisation, England, 2005-06**

Source: KC53 The Information Centre

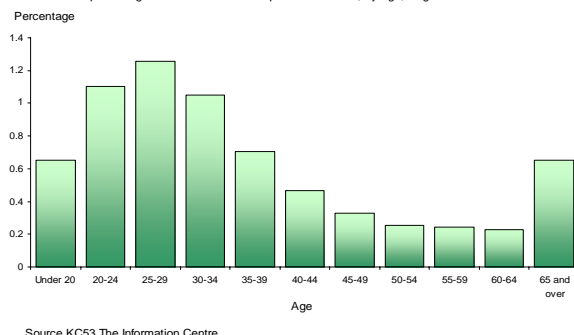

(21%) had screening tests not prompted by the programme, i.e. tests initiated by the sample taker or opportunistically by the woman, without her necessarily having been invited. In particular, some women are routinely recalled by their GPs earlier than at the locally agreed standard interval. Because women recorded as having a test not prompted by the programme may nevertheless have been invited through such a GP programme, it is not possible to calculate the percentage uptake of invitations from the call/recall database.

2.3 Test results (Tables 6, 7, 8, 11 and 12)

2.3.1 Some women have more than one test during the year and the 3.6 million women of all ages tested in 2005-06 generated 3.9 million tests. About 1 in 14 tests do not have a result, as the sample is "inadequate" i.e. it does not contain material suitable for analyses (see 3.1.2 below). For women tested again due to an earlier inadequate test, 16% resulted in a repeated inadequate result.

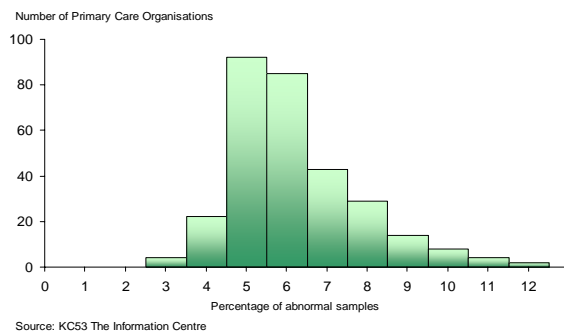

2.3.2 Of the 3.3 million women aged 25-64, who did have a result in 2005-06, 93.8% were negative, 3.2% showed borderline changes, 1.8% showed mild dyskaryosis, 0.5% showed moderate dyskaryosis, 0.6% showed severe dyskaryosis and 0.1% showed glandular neoplasia. The percentage of results which are severe or worse shows a distinct pattern by age, being highest at 1.2% for women aged 25-29, falling to 0.2% for women aged 60-64 (Figure 4).

Figure 4 Cervical screening: women with test results showing severe dyskaryosis or worse as a percentage of all women with adequate test results, by age, England 2005-06

2.3.3 Across the country as a whole, about 6% of women aged 25-64, with at least one adequate test result, had a result categorised as abnormal (including severe dyskaryosis or worse). At PCO level, in 242 of the 303 PCOs the proportion of women presenting with an abnormal result was between 4% and 8%. In 43 the proportion was between 8% and 10%; and in 18 PCOs the proportion lay outside the range 4% to 10% (Figure 5).

Figure 5 Cervical screening: Percentage of test results from women 25-64, that were abnormal by Primary Care Organisation, England 2005-06

2.4 Time from screening to notification of result (Table 9)

2.4.1 Information about the time from the taking of a sample to the notification of the test result is currently available only where the result letter is sent by the Primary Care Organisation. This was reported as occurring in 92% of cases overall, though there were large differences between regions. Where result letters were sent by PCOs 32% were sent within 4 weeks of the sample being taken, compared with 29% in 2004-05. A further 43% were sent more than 4 weeks but within 8 weeks. In 5% of cases, the time to notification was over 12 weeks compared with 4% in 2004-05.

2.5 Recall status (Table 10)

2.5.1 Normal recall status, defined as action code A (routine recall), may be used only where the test result is negative. In 2005-06, about 86% of women who had nothing other than a negative test result in the year had a normal recall status. Almost all the remaining women with negative results

(13%) had a repeat recall status; and about 1% had a suspend recall status.

2.5.2 Repeat recall status, action code R, requires a further test earlier than routine recall, typically within 6 months of the previous test. This may be used where a test result is negative, inadequate, borderline or mild dyskaryosis. In 2005-06, about 42% of women whose most severe test result in the year was mild dyskaryosis had a repeat recall status; the corresponding proportion for borderline was 79%, and for inadequate 96%. The balance of women in these three groups had a suspend recall status.

2.5.3 Suspend recall status, action code S, is an indication that recall has been suspended due to referral. This should be the only allowable status following a test result of moderate dyskaryosis or worse. In 2005-06, all women whose most severe test result in the year was moderate dyskaryosis or worse had a suspend recall status; no women were recorded with repeat recall status.

3 ANALYSIS AND COMMENTARY - CERVICAL CYTOLOGY

3.1 Samples examined (Tables 14, 15, 17 and 19)

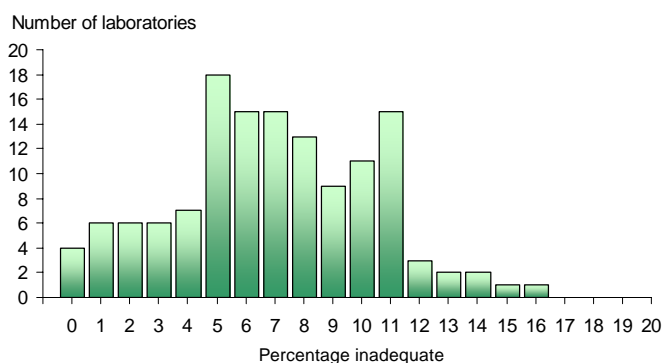

3.1.1 An estimated 4.0 million samples were examined by pathology laboratories in 2005-06, about 1.2% less than in 2004-05. About 3.7 million (93% of the total) were submitted by GPs or by NHS community clinics - almost all these would be samples taken as part of the screening programme; a further 0.2 million (6%) were from NHS hospitals - most of these were probably samples taken following the discovery of symptoms or cytological abnormality.

3.1.2 Of the GP and NHS Community Clinic samples examined in 2005-06 for women aged between 25 and 64, 7.2% were inadequate specimens for which no result could be determined, a lower proportion than in any of the previous years. The proportion of samples found inadequate is related to the women's age.

In 2005-06 for women aged under 30 about 9% of samples were found inadequate. The proportion was lower with each succeeding older age band and for women aged 60 or over only about 5% of samples were found inadequate. Overall, the proportion inadequate was around 6% in the years 1989-90 to 1992-93, but rose in each year to 1999-2000 where it peaked at 9.8%. Since 1999-2000 the percentage has fallen reaching 7.2% in 2005-06.

3.1.3 At laboratory level, there was wide variation in the proportion of samples judged to be inadequate. The use of liquid based cytology (LBC) began in April 2001 with three pilot laboratories. In October 2003 the National Institute for Clinical Excellence recommended its use nationally. It is expected that the use of LBC will substantially reduce the proportion of inadequates and figures for 2006 seem to confirm this with a drop of 2% from last year to 7.2%. During 2004-05, a number of laboratories began the conversion to LBC and by 2006 almost 50% of labs had converted. Most laboratories had inadequate results of less than 9%, around a quarter had between 9% and 12%, the remainder (9 labs) lay between 12% and 17% (Figure 6).

3.2 Results (Tables 15, 16 and 19)

3.2.1 The percentage of adequate GP and NHS Community Clinic samples tested in 2005-06 for women aged 25-64, which were reported as being negative was 94.1%. Borderline changes were found in 3.2% of adequate tests, mild dyskaryosis in 1.6%, moderate dyskaryosis in 0.5% and severe dyskaryosis in 0.5%; suspected invasive carcinoma or glandular neoplasia were found in less than 0.1% of samples. Generally, the older the women the higher the proportion of tests found to be negative; but also the proportion of tests showing suspected invasive carcinoma or glandular neoplasia increases with age. Borderline changes and mild dyskaryosis occurred more frequently in samples from younger women; moderate dyskaryosis accounted for a higher proportion of results from women aged 20-29 than from women in other age groups; the proportion of severe dyskaryosis was highest in samples from women aged 25-34.

3.2.2 At laboratory level there was wide variation in the percentage distribution of results, in particular in the proportion reported as borderline.

3.2.3 The distribution of the individual laboratory results is used for quality assurance purposes, as set out in sections 8.2 – 8.4 of the second edition of Achievable standards for Cervical Cytopathology, NHSCSP publication No 1, May 2000.

Target ranges for laboratory reporting are set from the 10th and 90th percentiles of the distributions of 4 key indicators. The ranges for 2004-05 and 2005-06 are set out in Table A which report on women aged 25-64 tested in GP or NHS Community Clinics and include results from all laboratories. Ranges for 'percentage inadequate' will not be shown until the phased roll out of LBC, which affects the inadequacy rate, is complete.

Table A

Indicator	10th - 90th percentile range*	
	2004-05	2005-06
Mild / borderline as % of adequate samples	3.2% - 7.2%	3.4% - 7.0%
Moderate or worse as a % of adequate samples	0.8% - 1.3%	0.7% - 1.4%
PPV for CIN2 or worse	65% - 87%	66.9% - 87.0%
Number of laboratories whose results were used	140	134

Source : Form KC61

* Based on results from women aged 25-64 from GP and NHS Community Clinics

© Data prior to 2005, re-used with the permission of the Department of Health.

3.2.4 Average times from the receipt of the specimen at the laboratory until the authorisation of the report reduced slightly in 2005-06. 31% of tests were reported within 2 weeks of receipt at the lab, up from 29% in 2004-05, a further 27% were reported within 4 weeks (32% in 2004-05). Just over 9% of tests were reported more than 8 weeks after receipt (2% more than 2004-05).

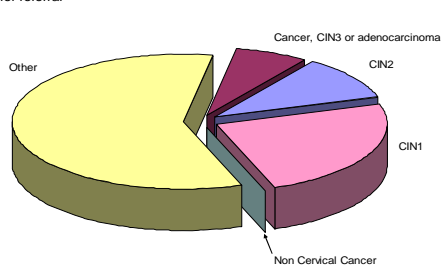

3.3 Outcome of gynaecological referrals (Tables 18, 18a and 19)

3.3.1 Information about outcomes of gynaecological referrals for tests registered during April – June 2005 was provided by all laboratories with sizeable numbers of screening programme tests.

3.3.2 For women referred following persistent non-negative tests whose referral outcome was known, only 0.1% were found to have cervical cancers and 6.9% showed CIN3 or adenocarcinoma in situ; 10.2% showed CIN2 and 24.1% showed CIN1; 11.4% showed HPV only, 16.2% showed no CIN or HPV, 1.6% were inadequate biopsies and in 28.6% no

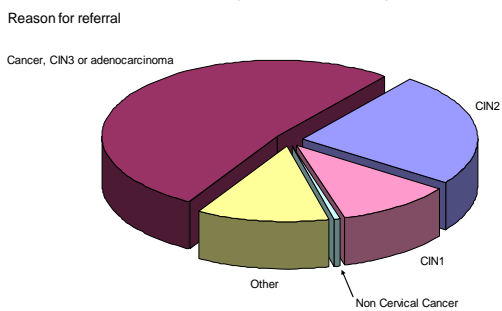

abnormality was detected at colposcopy. Non-cervical cancers were identified from 0.1% of referrals (**Figure 7**).

Figure 7a Outcome of referral by reason for referral, persistent non-negative test result, England 2005-06

Source: KC61 The Information Centre

Figure 7b Outcome of referral by reason for referral, Single occurrence of potentially significant abnormality, England 2005-06

Source: KC61 The Information Centre

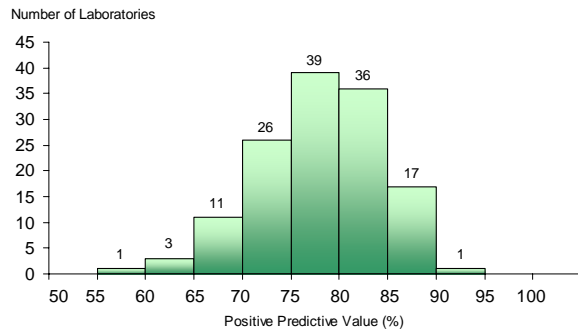

3.3.3 For referrals with known outcomes following a single occurrence of a potentially significant abnormality, 2.2% were found to be cervical cancers and 50.0% showed CIN3 or adenocarcinoma in situ; 24.1% showed CIN2 and 10.8% showed CIN1; 3.0% showed HPV only, 5.3% showed no CIN or HPV, 0.8% were inadequate biopsies and in 2.6% no abnormality was detected at colposcopy. Non-cervical cancers were identified from 0.6% of referrals.

3.3.4 A positive predictive value (PPV) was calculated for each laboratory (see 5.3 below for a definition); reported PPVs ranged from 53% to 97% with the majority lying between 65% and 85% (**Figure 8**).

3.3.5 Retrospective information regarding referrals from an earlier complete year was collected again in 2005-06, relating to referrals in the 12 month period April 2004 to March 2005. The whole year results were in fact very similar to the results reported last year except that the

proportions found to have the more severe results were slightly higher.

Figure 8 Positive Predictive Values¹, England 2004 to 05

4 ANALYSIS AND COMMENTARY - COLPOSCOPY

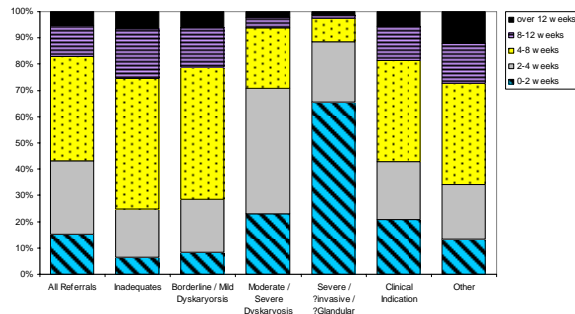

4.1 Referrals for colposcopy (Tables 20 and 21)

4.1.1 Details of the first referrals of each quarter to each clinic were recorded, regardless of whether or not the woman kept her appointment. Over 129,000 referrals to colposcopy were reported in 2005-06. Of these 80% were reported as being triggered by a screening test and 17% were clinically indicated. Of women referred to colposcopy after a screening test, over a third followed findings of borderline changes or mild dyskaryosis; about 1 in 6 referrals followed findings of moderate dyskaryosis and a slightly smaller proportion followed findings of severe dyskaryosis or worse.

4.1.2 Clinics were asked to supply data on the time between the date on the woman's referral letter and her first offered out patient appointment, regardless of whether she attended the appointment or not. Where direct referral systems are in operation, the referral date has been taken to be the date the test was reported. In 2005-06, 15% of women were offered an appointment within 2 weeks, rising to 43% within 4 weeks and 83% by 8 weeks from referral. Women with more serious test results tended to be offered appointments earlier; 71% of the women with a result of moderate or severe dyskaryosis were offered an appointment

within 4 weeks (an increase of 3% compared with 2004-05) (Figure 9).

Figure 9 Women referred to colposcopy: time from referral to first offered appointment, England 2005-06

Source: KC65 The Information Centre

4.1.3 At regional level, the percentage of all women offered an appointment within 8 weeks ranged from 71% in London to 92% in the North East. For those with moderate or severe dyskaryosis the percentage seen within 4 weeks ranged from 56% in the South West to 91% in the North East.

4.1.4 The time from referral to first offered appointment was over 12 weeks for 5% of women referred. When returning their data a number of clinics indicated that patients had requested a delayed appointment for personal reasons or where treatment for another condition had to be completed before colposcopy could take place.

4.2 Appointments for colposcopy (Table 22)

4.2.1 During 2005-06 a total of 379,800 appointments were reported at colposcopy clinics. Of these, 42% were new appointments, i.e. all appointments offered for a first visit, 8% were for return for treatment and 50% were follow-up appointments.

4.2.2 Broadly speaking, out of every 10 new and return for treatment appointments, 8 were attended, 1 was cancelled by the patient and 1 was where the patient failed to turn up with no advance warning being given. Two percent of new appointments and 3% of return for treatment appointments were cancelled by the clinic.

4.2.3 Only 67% of follow-up appointments were attended; 12% were cancelled by the patient and 5% by the clinic. In 16% the patients failed to turn up.

4.3 First Attendances at colposcopy (Table 23)

4.3.1 Clinics are required to supply details of all treatment and procedures undertaken at first attendance at the colposcopy clinic. The data collected relates only to procedures undertaken the first time a woman attends. In the case of deferred treatment the woman will be recorded as having no treatment at her first attendance.

4.3.2 Just over 123,300 first attendances at colposcopy were reported in 2005-06. Most will relate to a referral in that year, although some women attending may have been referred in a previous year and some of the women referred in this year will attend in the next.

4.3.3 Overall, 63% women attending had some treatment or procedure at first attendance. For those attending with high-grade abnormalities, the proportion was 83%.

4.3.4 The most common treatment or procedure at first attendance was diagnostic biopsy. This was carried out at about 45% of all first attendances. The use of this procedure was more common amongst those attending with low-grade abnormalities. For those attending with high-grade abnormalities the most common treatment at first attendance was excision.

4.3.5 Of women attending with high-grade abnormalities, 44% were treated by excision and 38% had a diagnostic biopsy. Conversely, of those attending with low-grade abnormalities, 59% had a diagnostic biopsy and only 6% underwent excision.

4.3.6 Treatment patterns vary considerably at local and regional level. The percentage of all women receiving some treatment or procedure at first

attendance ranged from 51% in the West Midlands to 74% in the North East. Similar patterns are reported in the use of treatment for those attending with both high and low grade abnormalities.

4.3.7 The use of diagnostic biopsy for those attending with a high-grade abnormality ranged from 23% in the West Midlands to 60% in London. For low-grade the equivalent range was 37% in the West Midlands to 74% in the North East.

4.3.8 The use of excision at first attendance was more common for those attending with a high-grade abnormality. It ranged from 20% in London to 62% in the East of England.

4.3.9 It is likely that the majority of those women presenting with high-grade abnormalities and reported as having either no treatment or a diagnostic biopsy went on to receive therapeutic treatment at a subsequent attendance.

4.4 Biopsies (Tables 24 and 25)

4.4.1 For each biopsy taken, the time elapsing before the woman is informed in writing of her result is recorded. The interval measured is the time between the date on which the biopsy was taken and the date on the letter that is sent to the patient informing her of her result. In order to allow time for follow up of results, the return relates only to those biopsies taken in the first month of each quarter. The data include all biopsies taken, not just those taken from women on first attendance. It is possible that more than one biopsy may be taken from the same woman.

4.4.2 Just over 46,000 biopsies were reported by clinics in the four sample months in 2005-06. These represent approximately one third of the total annual workload. The woman was informed of her result within 2 weeks in 27% of all cases, with a further 37% being informed within 4 weeks, 6% of women had not been informed of their result within 12 weeks. This figure includes cases where the

result had yet to be reported to the clinic. Variations in working practices may account for this delay: for example, where a cytology test has been taken at the same time as a biopsy, the clinic may not report the biopsy result until the cytology result is also known.

4.4.3 Clinics are asked to supply data on the histological result for each biopsy taken. Of all biopsies reported about 62% were diagnostic, 36% were excision and the remaining 2% were other non-diagnostic biopsies.

4.4.4 Of all non-diagnostic biopsies i.e. excision biopsies and other non-diagnostic biopsies, taken in 2005-06 86% showed evidence of CIN or worse. The proportion ranged from 82.1% in the South East Coast 92.4% in South Central.

4.5 Clinic data (Tables 26a and Table 26b)

Colposcopy data for individual clinics is shown in **Tables 26a and 26b**. These may be used to identify different treatment patterns across the country and show wide variation between clinics. Some of this variation may arise from the fact that many clinics deal with only a small number of cases and this should be borne in mind when interpreting the clinic level results.

5 DEFINITIONS

5.1.1 Coverage is defined as the percentage of women in a population eligible for screening at a given point in time who were less than a specified period [the headline coverage figure relates to 5 years] since their last test producing an adequate test result. Women ineligible for screening, and thus not included in the numerator or denominator of the coverage calculation, are those whose recall has been ceased for clinical reasons (most commonly due to hysterectomy).

5.1.2 Local level coverage is calculated for Primary Care Organisations (i.e. Primary Care Trusts or Care Trusts). Although PCOs do have a defined geographical

boundary, the populations used are not those of women resident within the PCO boundaries. Instead the populations of women for whom each PCO is responsible are used. Responsible populations include women on the list of GPs who comprise the PCO, regardless of which geographical PCO they live in; where women on the call/recall register are not under the care of a GP at the time coverage is calculated, they are allocated to a PCO on a geographical basis.

5.2 The terms “severe dyskaryosis or worse”, “abnormal” and “negative” used in the text to describe the result of a cytology test are defined as follows in terms of the categories used on the cytology report form HMR 101/5:

Severe dyskaryosis or worse: HMR 101/5 cat. 4 (severe dyskaryosis), cat. 5 (severe dyskaryosis /? invasive carcinoma) or cat. 6 (? glandular neoplasia); women who have such test results are usually referred directly for further investigation, eg biopsy.

Abnormal: HMR 101/5 cat. 3 (mild dyskaryosis), cat. 7 (moderate dyskaryosis) or cat. 8 (borderline changes); women who have an abnormal test categorised as result code 3 or 8 will usually be recalled early for another test. Women who have an abnormal test categorised, as result code 7 will be referred immediately for further investigation, eg colposcopy.

Negative: HMR 101/5 cat. 2 (negative); women with a negative test result will be returned to the screening programme to be called again at the normal interval (usually 3 or 5 years).

5.3 A positive predictive value (PPV) relating cytology with histology was calculated from outcomes of referral for tests with result moderate dyskaryosis or worse as follows:

numerator:
number of tests with outcome of referral cancer, adenocarcinoma in situ, CIN3 or CIN2.

denominator:
number of tests with outcome of referral known and not recorded as inadequate biopsy or colposcopy NAD.

5.4 Where parts of a return are missing, the corresponding parts have been apportioned using England averages.

5.5
There were a number of laboratory mergers and name changes in 2005-06. The conversion to liquid based cytology and general regional reorganisation has resulted in a number of smaller laboratories transferring their cervical cytology workload to other laboratories: The laboratories at North Tyneside, James Paget, Hinchingsbrook, West Dorset, Middlesex & Ealing Hospitals no longer carry out cervical cytology. This work is now incorporated into the workload of the North Royal Victoria Infirmary, Norfolk and Norwich Hospital, West Anglia Laboratories, Musgrove Park Hospital and Hammersmith Hospital.

Data have been presented (where appropriate) in the new Strategic Health Authorities format (as at 1st July) although the individual organisations and old SHAs are also shown, as they were at the time of data collection, in the organisational level tables.

INDEX TO TABLES

Table number	Description
1	Summary statistics on cervical cancer and the NHS cervical screening programme, 1996 to 2006
2	Cervical screening programme: test status of women and coverage by age, 10th August 2006
3	Cervical screening programme: test status of women by age (numbers), 10th August 2006
3a	Cervical screening programme: test status of women by age, 10th August 2006
4	Cervical screening programme: number of women invited in the year by type of invitation and age, 2005-06
5	Cervical screening programme: number of women tested in the year by type of invitation and age, 2005-06
6	Cervical screening programme: number of women aged 20-64 tested in the year by type of invitation and result, 2005-06
7	Cervical screening programme: number and percentage of tests in the year by type of invitation and result, 2005-06
8	Cervical screening programme: results of adequate tests by age, 2005-06
9	Cervical Screening Programme: Time from screening to notification of result by New Strategic Health Authority, 2005-06
10	Cervical Screening programme: Recall status by most severe screening result and New Strategic Health Authority, 2005-06
11	Cervical screening programme: Summary of regional data for women aged 25-64, 2005-06
12	Cervical screening programme: Target Age Group (25-64), results of tests by Primary Care Organisation, 2005-06
13	Cervical screening programme: coverage of the Target Age Group (25-64) by Primary Care Organisation, 2001-02 to 2005-06
14	Samples examined by pathology laboratories, by source of sample and result of test, 2005-06
15	GP & NHS Community Clinic samples examined by pathology laboratories, by result and age of women, 2005-06
16	Samples examined by pathology laboratories: Time from receipt of sample to authorisation of report by region, 2005-06

- 17 Samples examined by pathology laboratories, by source of sample, result of test and region, 2005-06
 - 18 Outcome of referrals for samples registered at the laboratory between April 2004 - March 2005, by Strategic Health Authority
 - 18a Outcome of referrals for sample registered at the laboratory between April - June 2005, by Strategic Health Authority
 - 19 GP and NHS Community Clinics samples from women aged 25-64 examined by pathology laboratories, by laboratory and result, 2005-06
 - 20 Women referred to colposcopy : referral indication of first offered appointment, by region 2005 - 06
 - 21 Women referred to colposcopy : time from referral to first offered appointment, by referral indication and region 2005 - 06
 - 22 Appointments for colposcopy: attendance status and appointment type, by region 2005 - 06
 - 23 Women referred to colposcopy : first attendance by result of referral, type of procedure and region 2005 - 06
 - 24 Biopsies taken at colposcopy: time from biopsy until patient informed of result, by region (4 month sample) 2005 - 06
 - 25 Non diagnostic biopsies taken at colposcopy: by type, outcome and region (4 month sample) 2005 - 06
 - 26a Summary statistics by colposcopy clinic, England 2005-06
 - 26b Summary statistics by colposcopy clinic (2), England April 2005 - March 2006
-
-

Source : KC53

(1) The denominator used in calculating the percentage is the resident population less those women with recall ceased for clinical reasons

(2) Excluding those women all of whose tests during the year were classified as 'inadequate'

(3) The first result in the year
